

Simple Linear Regression Summary — ASR ~ Parameter Count (n = 6)

Metric	Value	Interpretation
Slope ($\hat{\beta}$)	−2.05 pp/B	ASR decreases ~2 pp per billion parameters
Intercept	36.04\%	Predicted ASR at zero parameters (baseline)
R^2	0.447	Parameter count explains 44.7\% of ASR variance
p-value	0.146	Not significant at $\alpha = 0.05$
Std. Error	1.139	Uncertainty around the slope estimate
Conclusion	<i>n.s.</i>	<i>No statistically significant size-safety relationship</i>
